Elements of the Future of Medicine

- Personalized technology
- High speed and wireless
- Miniaturization
- Wearables and internal sensors for monitoring of health & disease
- Ever-present, analytics-enabled, real-time, individualized attention to prevent and treat disease

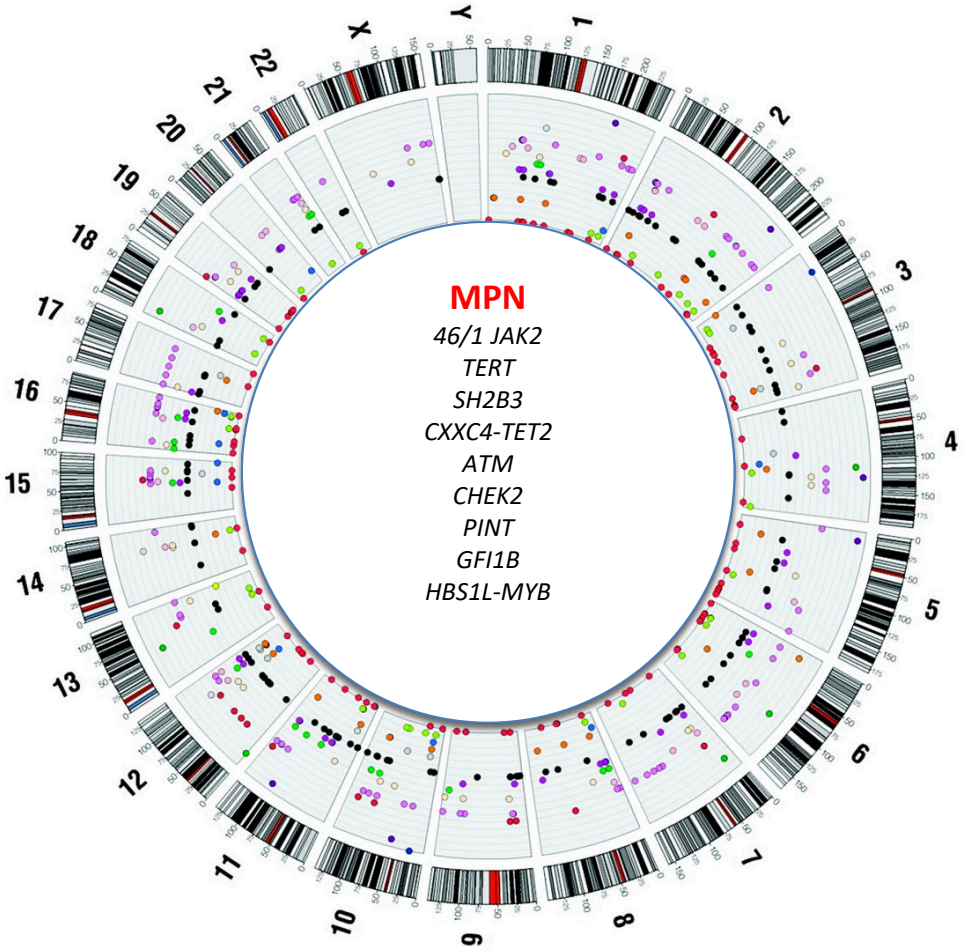
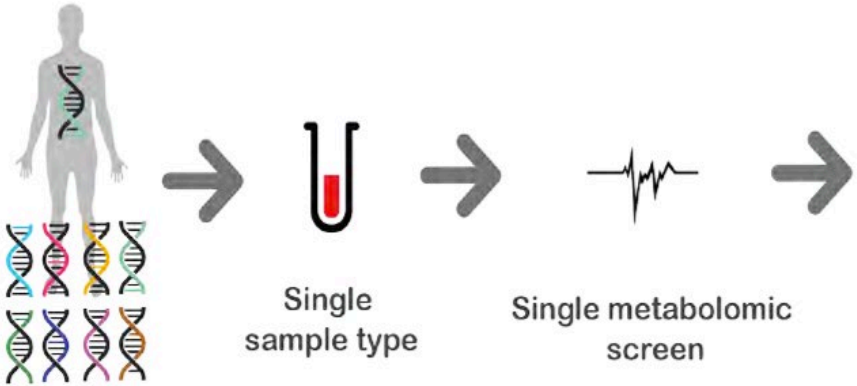
Predisposition to MPN

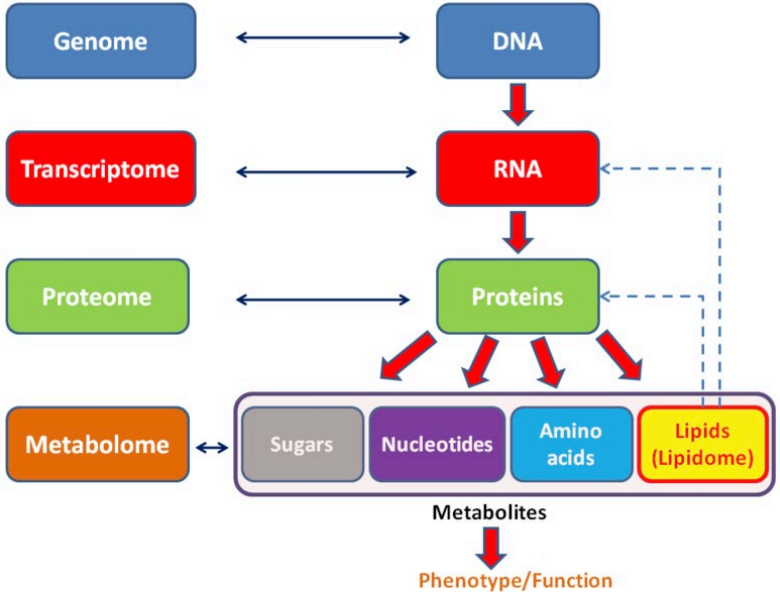
In 2033, Alex Saven is born and his parents wish to understand what are his future risks of disease

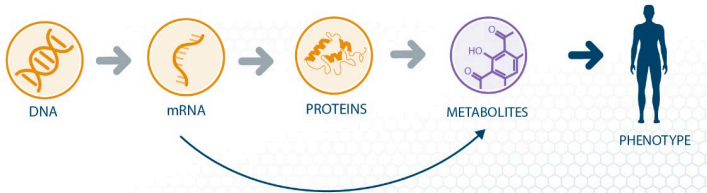
A fingerstick prick of blood or internal biosensor will be used to conduct an integrated scan of current health and a probability assessment of future heath risks, including MPN



Assessing Inherited Predisposition: More than Just Gene Variants







Cost is Decreasing Dramatically

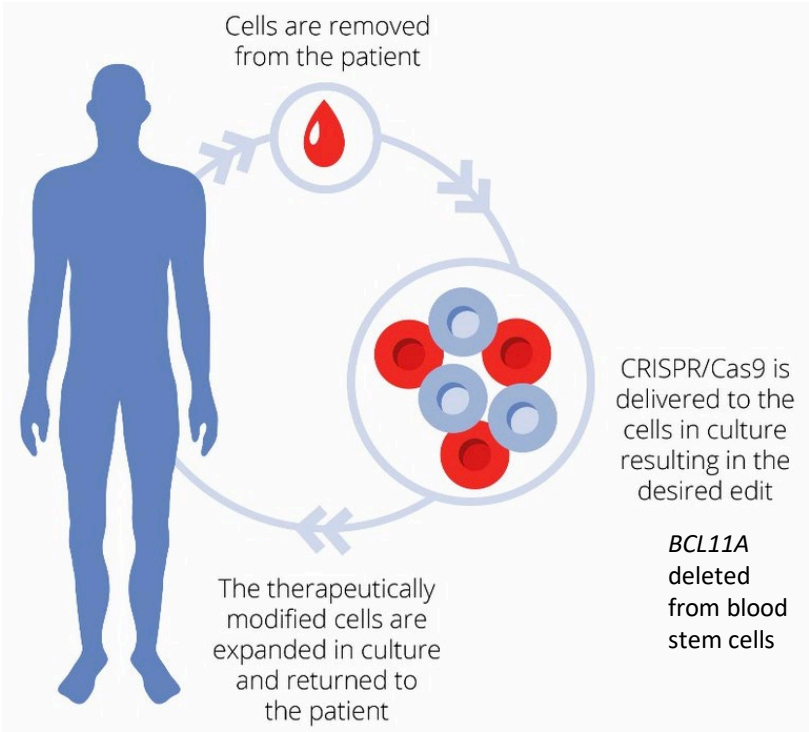
CRISPR Therapeutics and Vertex Pharmaceuticals

CTX001 works by cleaving a gene called *BCL11A*, which suppresses production of fetal hemoglobin

CTX001 could efficiently edit the target gene in more than 90 percent of hematopoietic stem cells to achieve about 40 percent of fetal hemoglobin production, which investigators believe is sufficient to improve a patient's symptoms.



Potential Issues/Concerns

- **Low-risk ET/PV**- is CRISPR needed?
- **Myelofibrosis**– genetically complex
- **Off-target safety concerns**
  - Accidental editing of tumor suppressor genes, oncogenes, or other parts of the genome

TRANSPLANTATION

Hematopoietic stem cell transplantation in immunocompetent hosts without radiation or chemotherapy

Akanksha Chhabra,[1]* Aaron M. Ring,[2,3,4]* Kipp Weiskopf,[2,3,4]* Peter John Schnorr,[1] Sydney Gordon,[2,3,4] Alan C. Le,[1] Hye-Sook Kwon,[1] Nan Guo Ring,[2,3,4] Jens Volkmer,[2,3,4] Po Yi Ho,[2,3,4] Serena Tseng,[2,3,4] Irving L. Weissman,[2,3,4,5] Judith A. Shizuru[1,2,3†]

Hematopoietic stem cell (HSC) transplantation can cure diverse diseases of the blood system, including hematologic malignancies, anemias, and autoimmune disorders. However, patients must undergo toxic conditioning regimens that use chemotherapy and/or radiation to eliminate host HSCs and enable donor HSC engraftment. Previous studies have shown that anti–c-Kit monoclonal antibodies deplete HSCs from bone marrow niches, allowing donor HSC engraftment in immunodeficient mice. We show that host HSC clearance is dependent on Fc-mediated antibody effector functions, and enhancing effector activity through blockade of CD47, a myeloid-specific immune checkpoint, extends anti–c-Kit conditioning to fully immunocompetent mice. The combined treatment leads to elimination of >99% of host HSCs and robust multilineage blood reconstitution after HSC transplantation. This targeted conditioning regimen that uses only biologic agents has the potential to transform the practice of HSC transplantation and enable its use in a wider spectrum of patients.

Chemotherapy-free Conditioning (Preparatory) Regimen for Transplantation

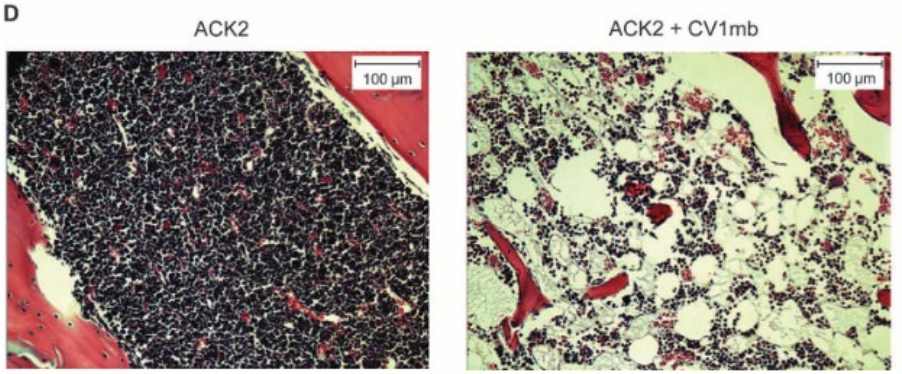

Fig. 3. Combining anti–c-Kit antibodies with CD47 blockade produces profound depletion of HSCs and clearance of the bone marrow niche in immunocompetent mice. (**A**) Total number of

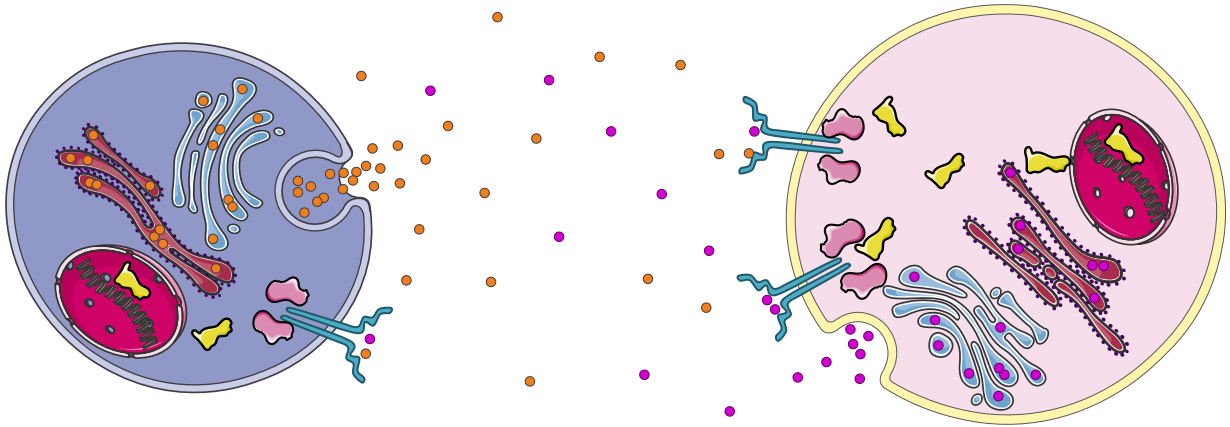
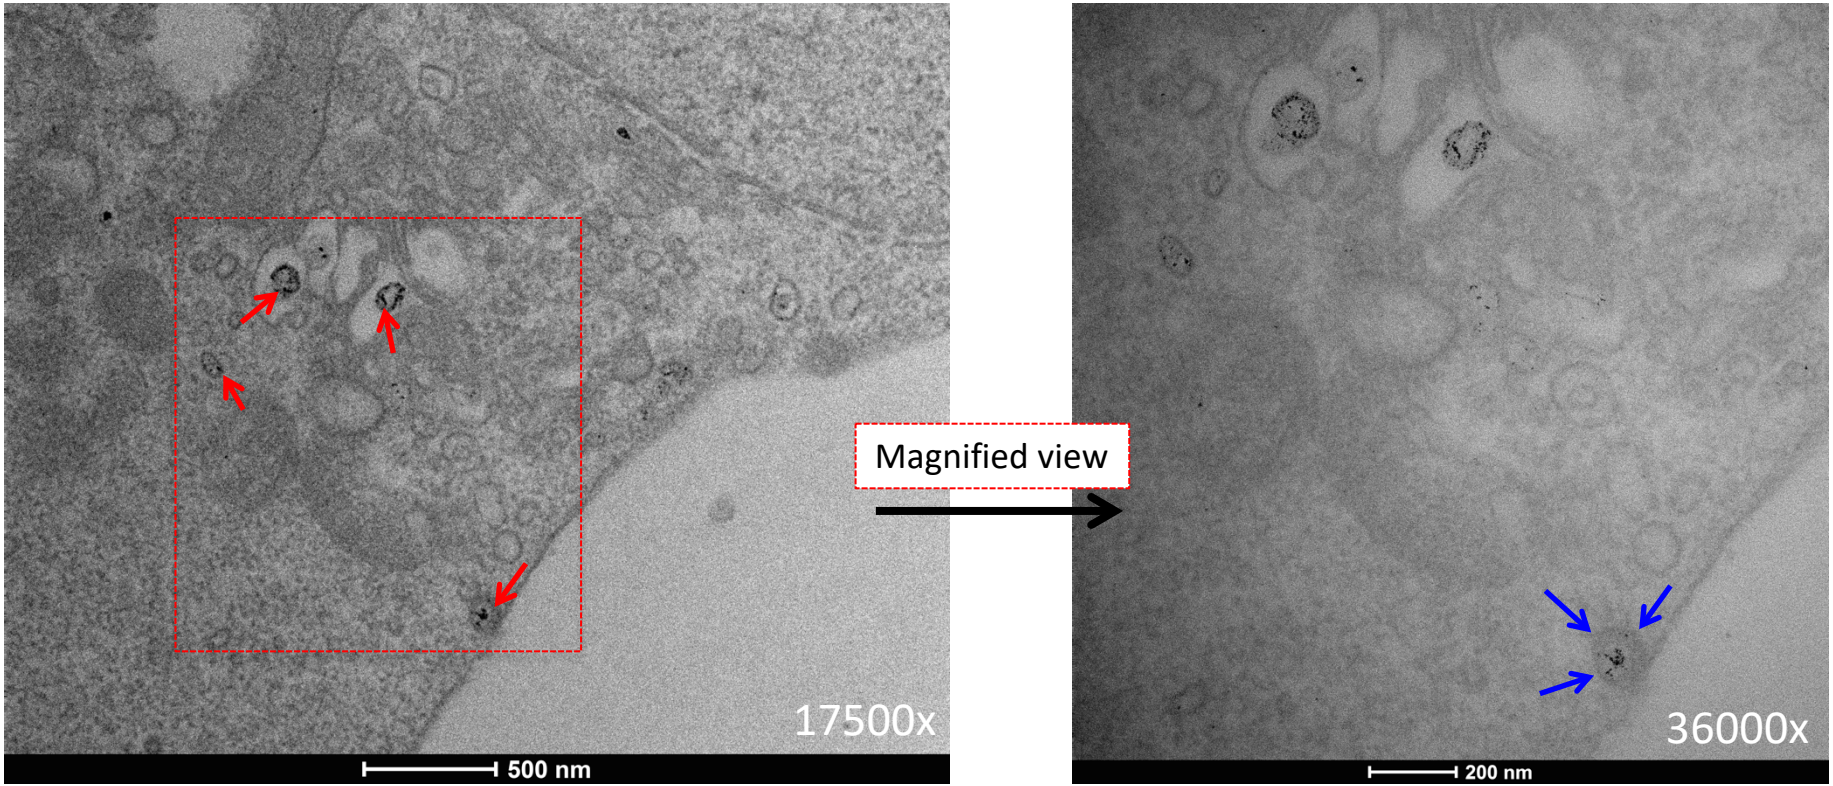
PLENARY ABSTRACT #4

Secreted Mutant Calreticulins As Rogue Cytokines



Christian Pecquet, Thomas Balligand, Ilyas Chachoua, Anita Roy, Gaelle Vertenoeil, Didier Colau, Emanuel Fertig, Caroline Marty, Harini Nivarthi, Jean-Philippe Defour, Erica Xu, Eva Hug, Heinz Gisslinger, Bettina Gisslinger, Martin Schalling, Ilaria Carola Casetti, Elisa Rumi, Daniela Pietra, Chiara Cavalloni, Luca Arcaini, Mario Cazzola, Norio Komatsu, Yoshihiko Kihara, Yoshitaka Sunami, Yoko Edahiro, Marito Araki, Isabelle Plo, William Vainchenker, Robert Kralovics and Stefan N Constantinescu

Mutant calreticulin goes through the secretory pathway and is secreted



Immuno-gold electron microscopy, using an anti-FLAG against FLAG-tagged CALR del52 expressed in the Ba/F3 cell line.

CALR mutant proteins are detected in plasma of patients with *CALR* mutations

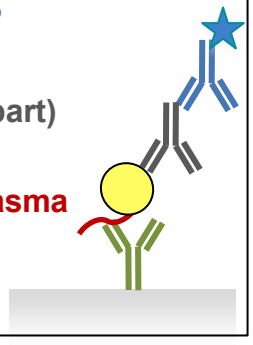
Sandwich-ELISA setup:

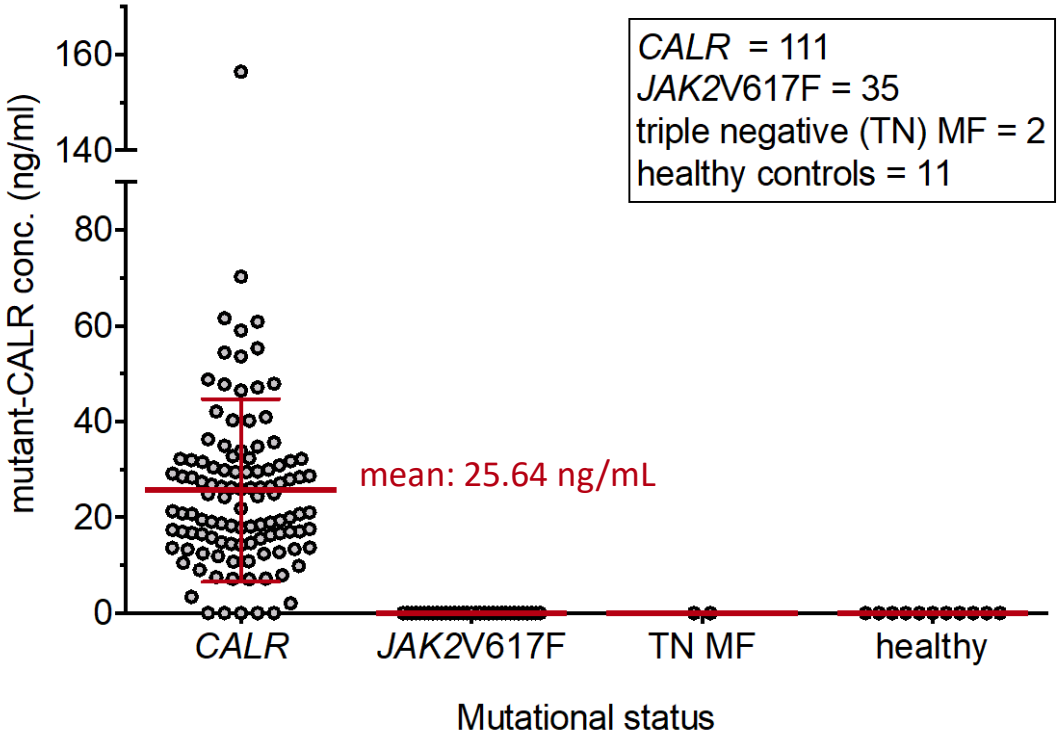
2° Ab: a-mouse-HRP

1° Ab:
a-CALR (common part)

Analyte:
mutant CALR in plasma

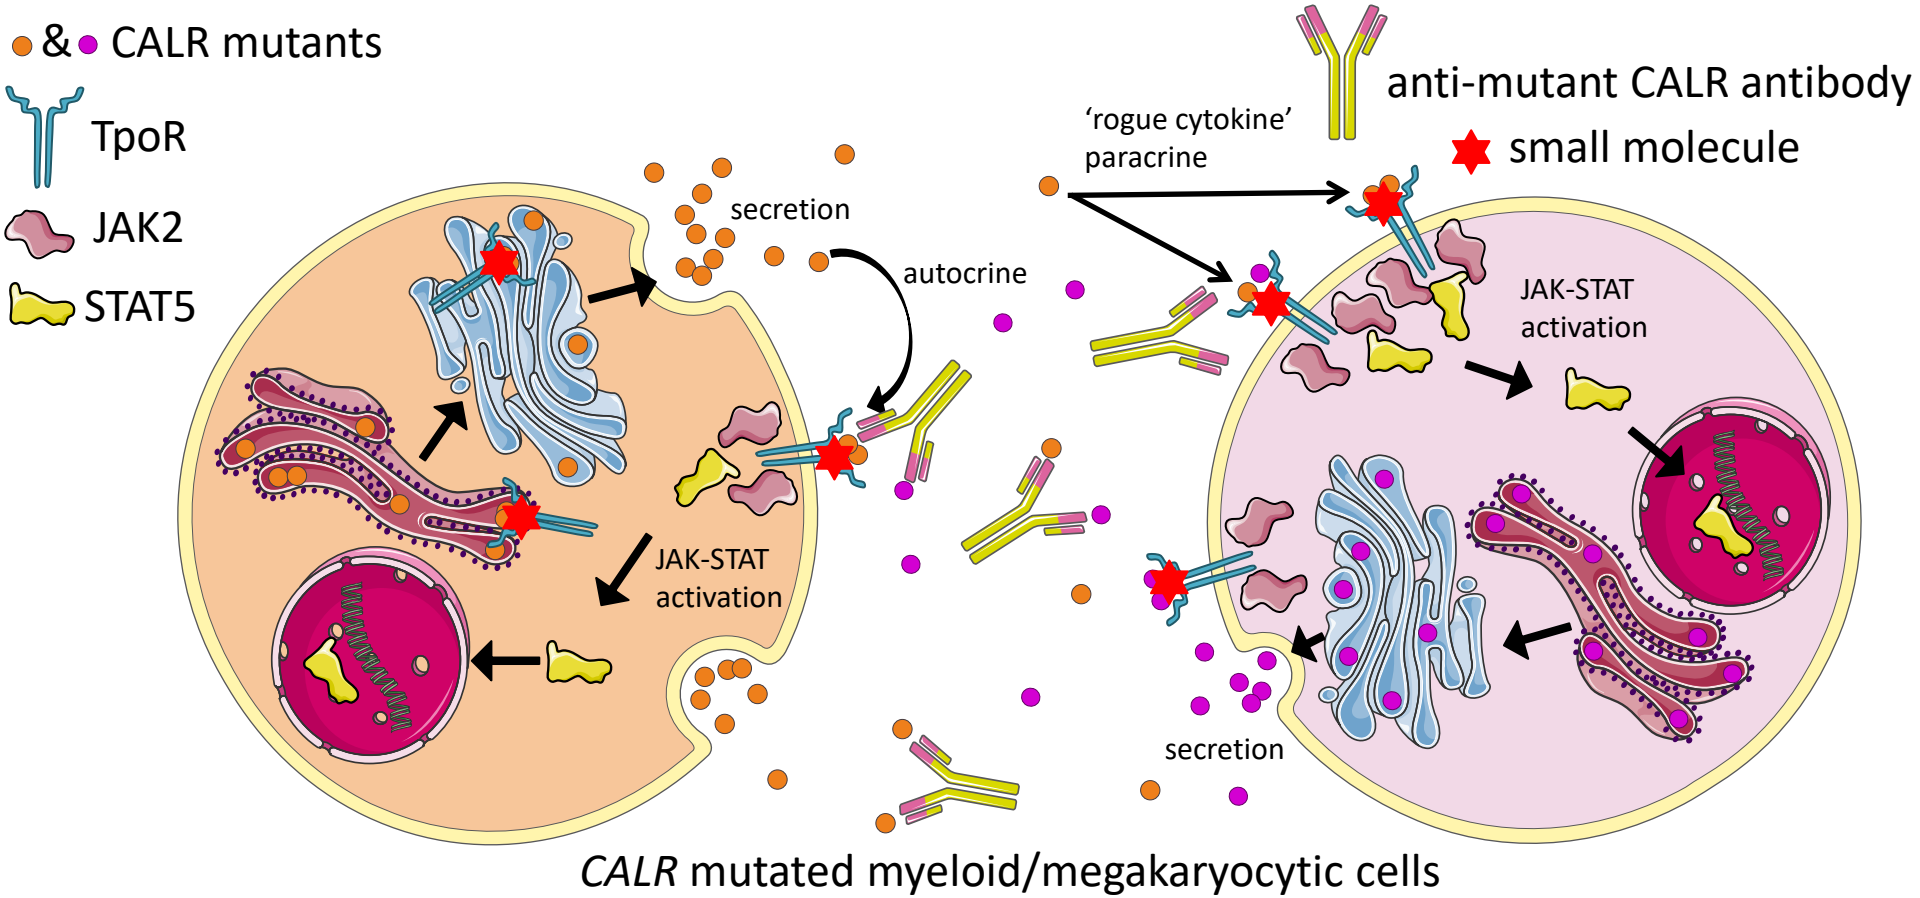
Coating Ab:
a-mutant CALR





By sandwich ELISA using antibodies directed against the mutant end-tail / common part of CALR proteins

CALR mutated cells secrete mutant CALR that acts in a autocrine and a ‘rogue cytokine’ fashion



CALR mutated myeloid/megakaryocytic cells

Peptide Vaccination Targeting CALR

ORIGINAL ARTICLE

The *calreticulin* (*CALR*) exon 9 mutations are promising targets for cancer immune therapy

MO Holmström[1,2], E Martinenaite[2], SM Ahmad[2], Ö Met[2,3], C Friese[2], L Kjær[1], CH Riley[4], P thor Straten[2,5], IM Svane[2,3], HC Hasselbalch[1] and MH Andersen[2,5]

The *calreticulin* (*CALR*) exon 9 mutations are found in ~30% of patients with essential thrombocythemia and primary myelofibrosis. Recently, we reported spontaneous immune responses against the *CALR* mutations. Here, we describe that CALR-mutant (*CALR*mut)-specific T cells are able to specifically recognize *CALR*mut cells. First, we established a T-cell culture specific for a *CALR*mut epitope. These specific T cells were able to recognize several epitopes in the *CALR*mut C terminus. Next, we established a *CALR*mut-specific $CD4^+$ T-cell clone by limiting dilution. These $CD4^+$ T cells recognized autologous *CALR*mut monocytes and hematopoietic stem cells, and T-cell recognition of target cells was dependent on the presence of *CALR*. Furthermore, we showed that the *CALR*mut response was human leukocyte antigen (HLA)-DR restricted. Finally, we demonstrated that the *CALR*mut-specific $CD4^+$ T cells, despite their phenotype, were cytotoxic to autologous *CALR*mut cells, and that the cytotoxicity was mediated by degranulation of the T cells. In conclusion, the *CALR* exon 9 mutations are targets for specific T cells and thus are promising targets for cancer immune therapy such as peptide vaccination in patients harboring *CALR* exon 9 mutations.

Leukemia advance online publication, 15 August 2017; doi:10.1038/leu.2017.214

Holmstrom *et al*, *Leukemia*, 2017

Summary: The Future of MPNs

- The future diagnosis and monitoring of MPNs will be real-time, wireless, personalized, and data-rich

- Treatment: harnessing the immune system to kill cancer

- The potential of genome editing is exciting, but will need to proceed with caution to understand safety issues and disease-specific role(s)
